# Recurrent Network

- ▶ Recurrent neural networks (RNNs) are a class of neural network that can learn about sequential data (e.g. time series, natural language)

one to one

E.g. image classification

one to many

E.g. image caption

many to one

E.g. sentiment analysis

many to many

E.g. language translation

many to many

E.g. predict next word in sentence

# Many to Many

- ▶ Weights  $U$ ,  $V$ ,  $W$  are shared across all steps
- ▶ Hidden state calculated by  $s_t = f(Ux_t + Ws_{t-1})$  where  $f$  is non-linear activation function
- ▶ Vanilla RNNs have problems learning long-term dependencies

# LSTM Cell

- ▶ First step is “forget gate” which learns how much information to throw away from existing cell state

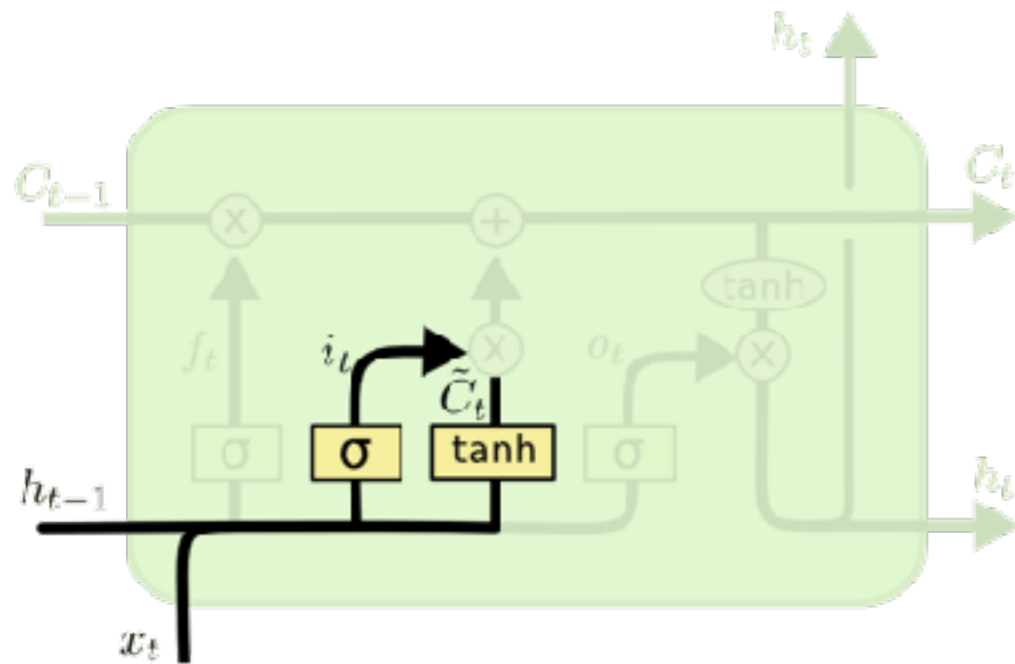

$$f_t = \sigma(W_f \cdot [h_{t-1}, x_t] + b_f)$$

# LSTM Cell

- ▶ “Input gate” decides which new information to store in the cell state by generating candidate state and filtering (using sigmoid)

$$i_t = \sigma(W_i \cdot [h_{t-1}, x_t] + b_i)$$

$$\tilde{C}_t = \tanh(W_C \cdot [h_{t-1}, x_t] + b_C)$$

# LSTM Cell

- ▶ Next add old and new cell states

$$C_t = f_t * C_{t-1} + i_t * \tilde{C}_t$$

# LSTM Cell

- ▶ Finally decide what to output - based on filtered version (using sigmoid) of cell state

$$o_t = \sigma (W_o [h_{t-1}, x_t] + b_o)$$

$$h_t = o_t * \tanh (C_t)$$

# Example

The screenshot shows a web browser window displaying the GitHub repository for 'karpathy/neuraltalk2'. The repository description is 'Efficient Image Captioning code in Torch, runs on GPU'. A terminal window is overlaid on the page, showing the command `lujit -e package.path=~/Users/kyl... /Users/kyle/Documents/Learning/neuraltalk2` and its output: `a mar in a hat and glasses is holding a cell phone`, `a mar in a hat and glasses is holding a cell phone`, `a mar in a hat and glasses is holding a cell phone`, and `a mar in a hat and glasses is holding a cell phone`. Below the repository page, a file explorer window shows the contents of the 'coco' directory, including folders like 'blstm-f-gpu', 'caffe', 'cgt', 'chainer', 'chainer-char-rnn', 'char-rnn', 'cnn-vis', 'cuparray', 'deepdream', 'DeepDreamTorch', 'DeepLearningTutorials', 'deeppose', 'deepcy', 'EmbeddingScripts', 'GRU4Rec', 'hebel', 'Kayak', and 'keras'. The 'CameraImage' application is highlighted, showing its metadata: 'Application - 17.2 MB', 'Created Today, 14:39', 'Modified Today, 15:57', and 'Last opened Today, 15:04'. A 'train.lua' file is also visible in the file explorer, with a note 'cleaning up the main directory'.

# Example

*Proof.* Omitted. □

**Lemma 0.1.** Let  $\mathcal{C}$  be a set of the construction.

Let  $\mathcal{C}$  be a gerber covering. Let  $\mathcal{F}$  be a quasi-coherent sheaves of  $\mathcal{O}$ -modules. We have to show that

$$\mathcal{O}_{\mathcal{O}_X} = \mathcal{O}_X(\mathcal{C})$$

*Proof.* This is an algebraic space with the composition of sheaves  $\mathcal{F}$  on  $X_{\text{étale}}$  we have

$$\mathcal{O}_X(\mathcal{F}) = \{ \text{morph}_1 \times_{\mathcal{O}_X} (\mathcal{G}, \mathcal{F}) \}$$

where  $\mathcal{G}$  defines an isomorphism  $\mathcal{F} \rightarrow \mathcal{F}$  of  $\mathcal{O}$ -modules. □

**Lemma 0.2.** This is an integer  $Z$  is injective.

*Proof.* See Spaces, Lemma ?? □

**Lemma 0.3.** Let  $S$  be a scheme. Let  $X$  be a scheme and  $X$  is an affine open covering. Let  $\mathcal{U} \subset X$  be a canonical and locally of finite type. Let  $X$  be a scheme. Let  $X$  be a scheme which is equal to the formal complex.

The following to the construction of the lemma follows.

Let  $X$  be a scheme. Let  $X$  be a scheme covering. Let

$$b : X \rightarrow Y' \rightarrow Y \rightarrow Y \rightarrow Y' \times_X Y \rightarrow X.$$

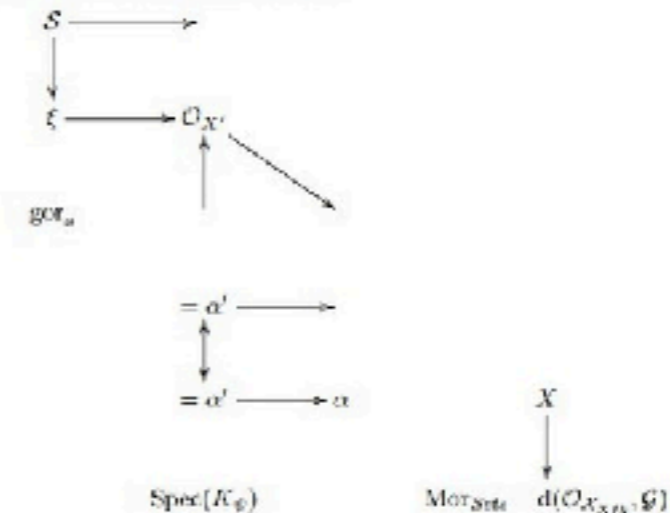

be a morphism of algebraic spaces over  $S$  and  $Y$ .

*Proof.* Let  $X$  be a nonzero scheme of  $X$ . Let  $X$  be an algebraic space. Let  $\mathcal{F}$  be a quasi-coherent sheaf of  $\mathcal{O}_X$ -modules. The following are equivalent

- (1)  $\mathcal{F}$  is an algebraic space over  $S$ .
- (2) If  $X$  is an affine open covering.

Consider a common structure on  $X$  and  $X$  the functor  $\mathcal{O}_X(U)$  which is locally of finite type. □

This since  $\mathcal{F} \in \mathcal{F}$  and  $x \in \mathcal{C}$  the diagram

is a limit. Then  $\mathcal{G}$  is a finite type and assume  $S$  is a flat and  $\mathcal{F}$  and  $\mathcal{G}$  is a finite type  $f_*$ . This is of finite type diagrams, and

- the composition of  $\mathcal{G}$  is a regular sequence,
- $\mathcal{O}_{X'}$  is a sheaf of rings.

□

*Proof.* We have see that  $X = \text{Spec}(R)$  and  $\mathcal{F}$  is a finite type representable by algebraic space. The property  $\mathcal{F}$  is a finite morphism of algebraic stacks. Then the cohomology of  $X$  is an open neighbourhood of  $U$ . □

*Proof.* This is clear that  $\mathcal{G}$  is a finite presentation, see Lemmas ??

A reduced above we conclude that  $U$  is an open covering of  $\mathcal{C}$ . The functor  $\mathcal{F}$  is a "Field"

$$\mathcal{O}_{X,x} \rightarrow \mathcal{F}_{\mathbb{F}}^{-1}(\mathcal{O}_{X_{\text{étale}}}) \rightarrow \mathcal{O}_{X'_x}^{-1} \mathcal{O}_{X_x}(\mathcal{O}_{X'_x}^{\mathbb{F}})$$

is an isomorphism of covering of  $\mathcal{O}_{X'_x}$ . If  $\mathcal{F}$  is the unique element of  $\mathcal{F}$  such that  $X$  is an isomorphism.

The property  $\mathcal{F}$  is a disjoint union of Proposition ?? and we can filtered set of presentations of a scheme  $\mathcal{O}_X$ -algebra with  $\mathcal{F}$  are opens of finite type over  $S$ .

If  $\mathcal{F}$  is a scheme theoretic image points. □

If  $\mathcal{F}$  is a finite direct sum  $\mathcal{O}_{X'_x}$  is a closed immersion, see Lemma ?? This is a sequence of  $\mathcal{F}$  is a similar morphism.

# SN Classification

- ▶ Supernovae are one of the last possible stages of stellar evolution at the end of a massive star's life
- ▶ Two possible causes
- ▶ Binary star systems (e.g. white dwarf accretes matter from companion star) results in gravitational collapse and explosion
- ▶ Very massive stars may undergo core collapse as the star runs out of nuclear fuel

# SN Classification

- ▶ Supernovae can be classified according to their light curves and absorption lines of chemical elements that appear in their spectra
- ▶ Type I and II are distinguished if they contain hydrogen or not
- ▶ Type I supernovae exhibit sharp maxima in their light curves and die away gradually
- ▶ Further subdivisions: Type 1a have a singly ionised silicon line
- ▶ Subtle differences in light curves!

Adapted from Chaisson & McMillan

# SN Classification

- ▶ Type 1a supernovae are particularly important in astronomy as they can be used as **standard candles**
- ▶ Provided evidence for accelerated expansion of the Universe (most likely caused by dark energy)
- ▶ Future surveys such as the Large Synoptic Survey Telescope (LSST) will measure the light curves  $\sim 10$  million supernovae
- ▶ Only have the resources to spectroscopically confirm 5000 to 10,000 supernovae
- ▶ Supernovae Photometric Classification Challenge was designed to test classification algorithms
- ▶ Input data consisted of set of 21,319 simulated supernovae with a **time series** of flux measurements in several bands, along with the supernovae type
- ▶ Data is split into a training and test set

# Recurrent Network

- ▶ Use many-to-many LSTM with averaging over outputs at each timestep

# Training

- ▶ Use TensorFlow with Keras library (Python) to train the network
- ▶ Performance dramatically improved using GPU
- ▶ Training performed in **epochs** (epoch is a complete pass over the training data)
- ▶ Weights updated in mini-batches of 1000 samples
- ▶ Training continued until loss of test set doesn't improve
- ▶ Network architecture investigated (e.g. number of hidden layers, units)
- ▶ Care taken not to overfit!

# Training

- ▶ Several metrics to assess performance (e.g. accuracy, confusion matrix, AUC score)
- ▶ Accuracy is ratio between the number of correct predictions and total number of predictions (a random classifier with 2 classes would have an accuracy of 0.5)
- ▶ With training fraction of 0.5, obtain accuracy of 94.8%
- ▶ Competitive with highly tuned feature extraction classifiers

# Classification

- ▶ Other novel use is that a pre-trained network can give very fast evaluation of supernovae type
- ▶ Useful for early detection in future surveys
