# Background

- There is a persistent donor organ shortage
- The typical organ donor today is older and has more comorbidities compared to 10 years ago
- Approximately 50% of potentially viable deceased donor kidneys are turned down locally, 20% discarded
- More than 30% of transplanted kidneys do not show acceptable outcome
- Current pre-transplant organ quality evaluation is based on *subjective* clinical assessment and unreliable
- There is an urgent need for *objective* pre-transplant organ assessment tools

# Background

Eurotransplant Annual Report 2017

- There is a persistent donor organ shortage
- The typical organ donor today is older and has more comorbidities compared to 10 years ago
- Approximately 50% of potentially viable deceased donor kidneys are turned down locally, 20% discarded
- More than 30% of transplanted kidneys do not show acceptable outcome
- Current pre-transplant organ quality evaluation is based on *subjective* clinical assessment and unreliable
- There is an urgent need for *objective* pre-transplant organ assessment tools

variance explained

# Current state-of-the-art

- Prediction models for post-transplant outcome based on clinical variables alone and are unreliable
- Most kidneys are preserved on a hypothermic (0-8°C) machine perfusion (HMP) device, which yields better outcome versus static storage, but no reliable organ assessment
- Many centres are interested in *normothermic* (37°C) ex vivo machine perfusion (NMP) as a platform for pre-transplant organ assessment
- But frankly, we have no idea what parameters and biomarkers during NMP tell us about kidney quality

# Current state-of-the-art

# Ex vivo kidney perfusion

Potential for pre-transplant organ assessment

# Ex vivo kidney perfusion

Potential for pre-transplant organ assessment

# Ex vivo versus in vivo physiology

Major lack of mechanistic understanding

# Normothermic MP as a diagnostic tool

**Table 1** *Ex vivo* normothermic perfusion assessment score

|  | Score |
|--|-------|
| Macroscopic assessment   |       |
| Grade I: excellent perfusion (global pink appearance)                  | 1     |
| Grade II: moderate perfusion (patchy appearance)                       | 2     |
| Grade III: poor perfusion (global mottled and purple/black appearance) | 3     |
| Renal blood flow (ml per min per 100 g)                                |       |
| Threshold $\geq 50$  | 0     |
| Threshold $< 50$   | 1     |
| Total urine output   |       |
| Threshold $\geq 43$  | 0     |
| Threshold $< 43$   | 1     |

# Urgent requirements

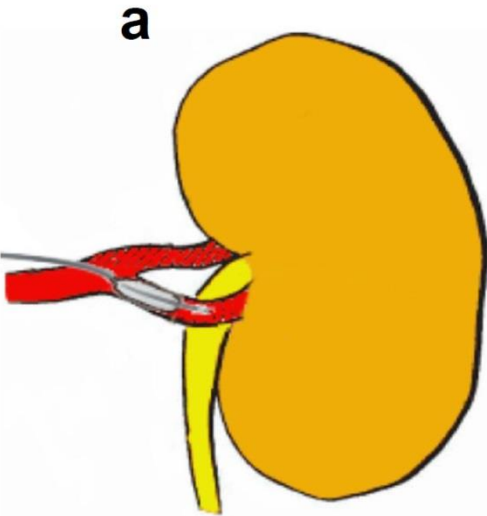

- **Better understand the molecular mechanisms that characterise ex vivo kidney perfusion**
- **Discover which parameters, biomarkers and molecular pathways are relevant for ex vivo pre-transplant organ assessment**

# Prior and preliminary work

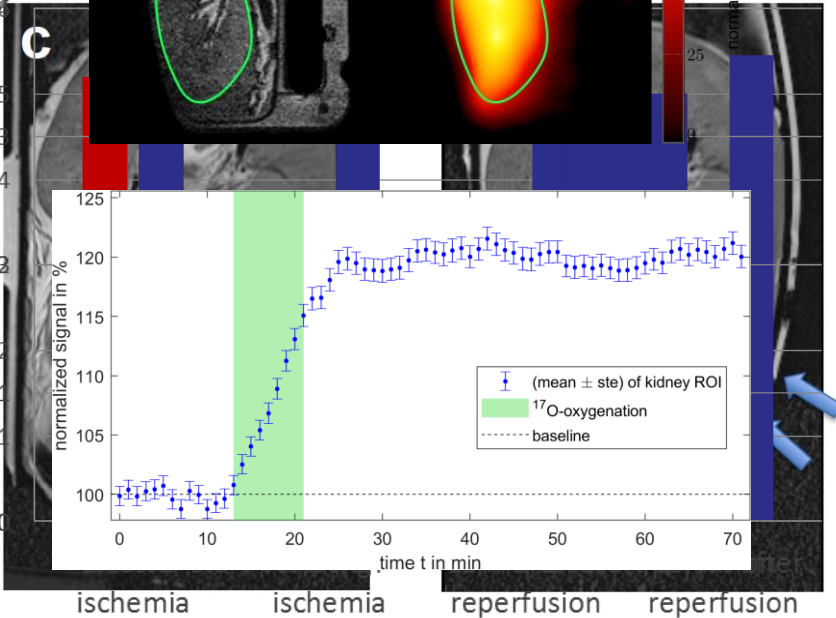

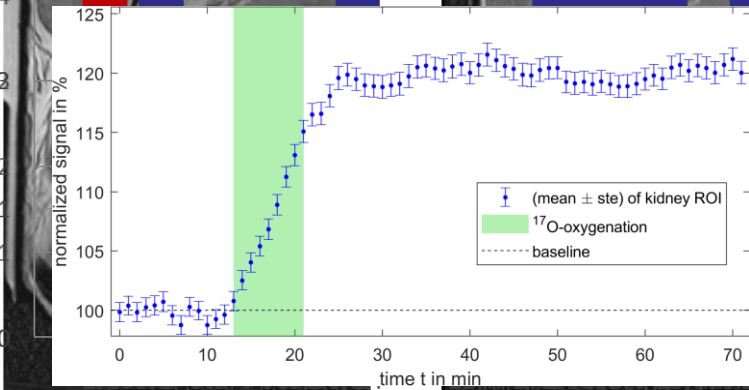

# MRI sequences

- Zoomed T2 weighted anatomical imaging detection of ischemic areas

ratio of cortical / medullar perfusion

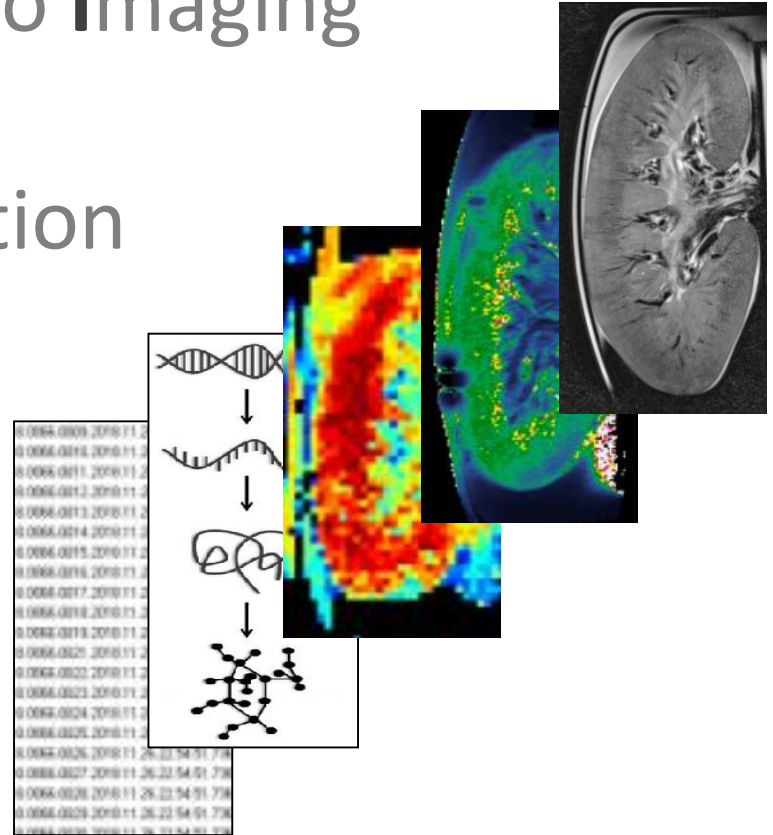

■ lower pole ■ whole kidney ■ upper pole (control)

# Post-transplant opportunities for MRI

- **Assessment of renal perfusion**
  - Replace observer-dependent ultrasound
  - Better pinpoint cause of perfusion problems
  - Less invasive vs. CT-angiography
- **Early graft dysfunction**
  - Replace invasive diagnostics
  - Early differentiation of causes
  - Rapid onset of targeted therapy
- **Urological complications**
  - Replace invasive diagnostics
- **Long term graft monitoring**
